

# GE Transportation

Anyone who has to fill out FRA forms on track, maintenance of way, or signaling components will appreciate the ease and efficiency of MapperTracker (patent pending). This GPS-based signaling, wayside, and track asset management tool from GE - Transportation streamlines the way you gather, transmit, and manage data.

Using a Microsoft®-based pocket PC, MapperTracker literally puts the railroad in your back pocket. GE builds a number of patented features into the MapperTracker for more precise reporting practices.

FRA reporting forms or your own company's forms are digitized within the MapperTracker system. Unique to MapperTracker, these automated forms cannot be opened unless the maintainer is actually at the specified location to be inspected. Mapper Tracker will automatically create custom weekly schedules for rail maintainers or, if preferred, schedules can be edited at any time.

The MapperTracker system's scalable permission feature allows signal supervisors to see a web-based inventory and maintenance schedule for their specific territory, and permits a broader territory view for those at higher supervisory levels.
